## Performance Tuning

June 23, 2009

If your computer seems to bit slow, try these:

### **Set Your Browser to Delete Temporary Files on Exit (IE7)**

This prevents the buildup of a lot of garbage on your hard drive.

Open Internet Explorer

Click on menu choice Tools and choose Internet Options

Click on the tab Advanced

Scroll to near the bottom of the list and check the box labeled

"Empty Temporary Internet files folder when Browser is Closed"

Click Apply and Exit

### **Delete Unneeded Files from Your Hard Drive**

Click on Start then My Computer

Right Click on Disk Drive C and choose Properties

Click on "Disk Cleanup"

Uncheck "Compress Old Files" if it is checked

Click on OK

### **Defrag your Hard Drive (XP)**

On the same Disk Properties screen as above, click on "Tools"

Click on Defrag now then click on Defragment

This may run for a while (5-20 minutes)

### **Force the System to Immediately Write Changes to your Hard Drive (XP)**

See CCS procedure on Disk Caching Titled:

**Protect Your Data! Disable Write-Behind Caching!**

### **Index and Defrag Your Complete Clinic System Files at Least Once a Month.**

In CCS, goto <F11 Utilities> and Choose <System Administration>

Choose <Index Files>

Check the Box labeled <Also Compress (defrag) Files>

Then click on start indexing (runs for 30 seconds to 3 minutes)
